

Amendments to the Claims

1. **(Currently amended)** An information terminal device for executing, based on an operation input by a user, a function corresponding to the operation, comprising:

an input section for inputting an operation required by the user;

an operation history storing section for storing information about the operation input to the input section; as an operation history;

an operation anticipating section for anticipating, when the operation is input to the input section, a next operation to be subsequently input by the user, based on the operation history information stored in the operation history information storing section; and

an anticipated operation supporting section for comparing an actual next operation, which is newly input from the input section, after the operation anticipating section has anticipated the next operation, with the anticipated next operation, and providing the user with a notification when the anticipated next operation is different from the actual next operation.
~~supporting execution of a function corresponding to the next operation anticipated by the operation anticipating section.~~

2-3. **(Cancelled)**

4 **(Original)** The information terminal device according to claim 1, wherein the operation history storing section stores the operation history information, which is operation information described in order of operations consecutively performed by the user.

5. **(Currently amended)** The information terminal device according to claim 1, wherein the operation history storing section stores the operation history information, which is operation information classified ~~and statistically described~~ in accordance with an item of operations consecutively performed by the user.

6. **(Currently amended)** The information terminal device according to claim 4, wherein the operation anticipating section is further operable to calculate ~~calculates~~ a frequency ~~about of~~ a next operation subsequently operated after the operation previously input to the input section, based on the operation history information, and ~~anticipates~~ anticipate, based on the calculated frequency, a next operation having a highest probability of being subsequently executed, as a next operation to be input by the user.

7. **(Currently amended)** The information terminal device according to claim 5, wherein the operation anticipating section is further operable to calculate ~~calculates~~ a frequency ~~about of~~ a next operation subsequently operated after the operation previously input to the input section, based on the operation history information, and ~~anticipates~~ anticipate, based on the calculated frequency, a next operation having a highest probability of being subsequently executed, as a next operation to be input by the user.

8. **(Currently amended)** The information terminal device according to claim 6, wherein the operation anticipating section is operable to calculate ~~calculates~~ the frequency from ~~in~~ ~~consideration of~~ at least one operation subsequently executed before the operation input to the input section.

9. **(Currently amended)** The information terminal device according to claim 7, wherein the operation anticipating section is operable to calculate ~~calculates~~ the frequency from ~~in~~ ~~consideration of~~ at least one operation subsequently executed before the operation input to the input section.

10. **(Currently amended)** The information terminal device according to claim 6, wherein the operation anticipating section is operable to calculate ~~calculates~~ the frequency based on the operation history information every time an operation is input to the input section.

11. **(Currently amended)** The information terminal device according to claim 7, wherein the operation anticipating section is operable to calculate ~~calculates~~ the frequency based on the operation history information every time an operation is input to the input section.

12. **(Currently amended)** The information terminal device according to claim 6, wherein the user is allowed to select whether a most recent frequency ~~calculated based on latest operation history information is used~~ or a previous ~~previously calculated~~ frequency is used for anticipating a next operation.

13. **(Currently amended)** The information terminal device according to claim 7, wherein the user is allowed to select whether a most recent frequency ~~calculated based on latest operation history information is used~~ or a previous ~~previously calculated~~ frequency is used for anticipating a next operation.

14-16. **(Cancelled)**

17. **(Original)** The information terminal device according to claim 6, wherein the operation anticipating section causes a next operation, which is opposite or contradictory to the operation input to the input section and included in next operations subsequently executed after the operation input to the input section, to be ruled out as a next operation to be anticipated.

18. **(Original)** The information terminal device according to claim 7, wherein the operation anticipating section causes a next operation, which is opposite or contradictory to the operation input to the input section and included in next operations subsequently executed after the operation input to the input section, to be ruled out as a next operation to be anticipated.

19. **(Cancelled)**

20. **(Original)** The information terminal device according to claim 1, further comprising an operation detecting section for determining whether or not the operation input to the input section is a predetermined operation, wherein

the operation anticipating section anticipates a next operation to be input by the user with respect only to an operation determined by the operation detecting section as a predetermined operation.

21. **(Original)** The information terminal device according to claim 1, further comprising an information managing section for managing special information about the operation input to the input section, wherein

the operation history storing section stores, as operation history information, information about the operation input to the input section along with the special information supplied from the information managing section, and

the operation anticipating section anticipates a next operation to be input by the user, based on the operation history information, which includes the special information, stored in the operation history storing section.

22. **(Original)** The information terminal device according to claim 21, wherein the special information includes at least any one of a date, a time, and a day of a week when the operation was input to the input section, a user type, an area, and a traveling status.

23. **(Currently amended)** An information terminal device for executing, based on an operation input by a user, a function corresponding to the operation, comprising:

an input section for inputting an operation required by the user;

a transmitting section for transmitting information about the operation input to the input section to a server as an operation history;

a receiving section for receiving, from the server, information about a next operation anticipated by the server to be subsequently input by the user after the operation input

to the input section, and

an anticipated operation supporting section for comparing an actual next operation, which is newly input from the input section after the operation anticipating section has anticipated the next operation, with the anticipated next operation, and providing the user with a notification when the anticipated next operation is different from the actual next operation.
~~supporting execution of a function corresponding to the next operation received by the receiving section.~~

24. **(Currently amended)** An information terminal device for executing, based on an operation input by a user, a function corresponding to the operation, comprising:

an input section for inputting an operation required by the user;

a storing section for storing, in a storage medium, information about the operation input to the input section; as an operation history;

an obtaining section for obtaining operation history information stored in the storage medium when the operation is input to the input section;

an operation anticipating section for anticipating a next operation to be subsequently input by the user after the operation input to the input section; and based on the operation history information obtained by the obtaining section; and

an anticipated operation supporting section for comparing an actual next operation, which is newly input from the input section after the operation anticipating section has anticipated the next operation, with the anticipated next operation, and providing the user with a notification when the anticipated next operation is different from the actual next operation.
~~supporting execution of a function corresponding to the next operation anticipated by the operation anticipating section.~~

25. **(Currently amended)** An operation supporting method performed by an information terminal device executing, based on an operation input by a user, a function corresponding to the operation, comprising the steps of:

inputting an operation required by the user;
storing information about the operation input at the inputting step, as an operation history, in a predetermined storing section;
when the operation is input at the said inputting step, anticipating a next operation to be subsequently input by the user after the input operation, based on operation history information stored in the storing section; and
comparing an actual next operation, which is newly input after said anticipating, with the anticipated next operation; and
providing the user with a notification when the anticipated next operation is different from the actual next operation.~~supporting execution of a function corresponding to the next operation anticipated at the anticipating step.~~

26. **(Currently amended)** A ~~program~~tangible computer readable medium having a program stored thereon to be executed by an information terminal device executing, based on an operation input by a user, a function corresponding to the operation, the program causing the information terminal device to execute the steps of:

inputting an operation required by the user;
storing information about the operation input at the inputting step, as an operation history, in a predetermined storing section;
when the operation is input at the inputting step, anticipating a next operation to be subsequently input by the user after the input operation, based on operation history information stored in the storing section; and
comparing an actual next operation, which is newly input after the anticipating step, with the anticipated next operation; and
providing the user with a notification when the anticipated next operation is different from the actual next operation. ~~supporting execution of a function corresponding to the next operation anticipated at the anticipating step.~~
